PREMEDITATED CLIMATE CRIME :

The 12th of December 2015, COP21 ended with the adoption of the Paris agreement by the international community, with the aim to contain global warming below the +2°C threshold until 2100, if not below +1.5°C.

Michael Greenstone, ex-leader of the White House economic department, maintains that if we burn all fossil fuel reserves, global warming would reach +9°C. This would be a climate genocide.

From there, how could we accept that oil and gas industries meet in order to figure out how to continue to explore and exploit new oil and gas reserves?

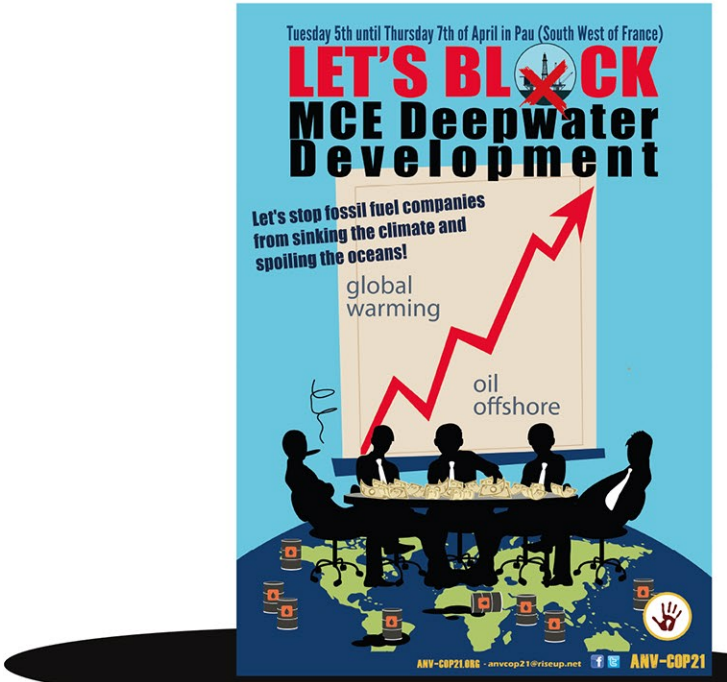
How could we accept that economic decision-makers, guided by profits and dividends, consciously choose to lead the world towards climate chaos and all its consequences: rising sea-levels, ocean acidification, multiplication of extreme weather events such as long-term droughts, intense precipitations and brutal flooding, hurricanes, increasing hunger and drinking-water shortage, forced migration of hundreds of millions of human beings, and all kinds of wars and crises?

Only just 4 months after COP21, the strategies that these "decision-makers" want to develop in Pau, lead us straight to uncontrollable and irreversible runaway climate change. This is a premeditated crime.
We have to prevent them from committing it!

LET'S BLOCK THE MCEDD SUMMIT !

The COP21 Non-Violent-Action Movement calls upon all climate and oceans defenders to come to Pau from 5th to 7th of April this year in order to physically prevent the holding of the MCEDD summit.

We call everybody to act in a 100% non-violent way, by taking clear and public responsibility for this act of massive and determined civil disobedience.
We ask everybody who will join us to do it with their faces uncovered, to respect the personal integrity of our adversaries, and to comply with the action rules we will define together.

We will multiply actions and massive mobilisations during three days, in order to physically prevent the holding or the successful conduct of the MCEDD summit.


COP21 objectives will remain a dead letter if citizens do not involve themselves in a decisive manner to prevent fossil fuels extraction and combustion, responsible for 80% of worldwide CO2-emissions, the root cause of climate change. The fate of this crucial fight for humanity is in the hands of our generation.
